ABSTRACT: The occurrence of the palm *Geonoma undata* Klotzsch is registered for the first time for the state of Zulia, Venezuela, as result of a floristic survey made at Cerro Las Antenas, in the Serranía de Perijá. This species is catalogued as “vulnerable” according to the Red Book of Venezuelan Flora.

Geonoma is one of the most diverse Neotropical palm genera and one of the most important numerically in the Andean region (Borchsenius and Moraes 2006; Mondragon *et al.* 2008). The genus consists of 68 species (Henderson 2011; The Plant List 2012) and is distributed from Mexico to Paraguay. In Venezuela there are 19 species (Stauffer 1999) distributed in the temperate rain forest of the Cordillera de la Costa and the Venezuelan Andes (Hoyos and Braun 2001). *Geonoma undata* Klotzsch has been known from South and Central America (Henderson *et al.* 1995; Govaerts and Dransfield 2005). Stauffer (1999) reported this species for the states of Aragua, Barinas, Federal District, Falcon, Táchira, Trujillo and Portuguesa. More recently Mondragon *et al.* (2008) reported it for Lara state. Here we extend the distribution of *G. undata* to northwestern Venezuela (Figure 1).

The exemplar was collected at 10°20'41"N and 072°33'39"W, at 1456 m on the northeast slope of Cerro Las Antenas in the Serranía de Perijá, near Caño De Oro, a tributary of the Lajas river in the Municipio Rosario de Perijá, Zulia state, northwestern Venezuela.

Botanical Description: Medium sized palm, about 6 m tall, solitary; erect trunk of about 10 cm, light brown. The crown shaft consists of 8 pinnate leaves, of from 1.4 to 2.5 m long, leaf sheath well developed, red; leaves with 10-12 pairs of pinnae, irregular or almost regularly divided, wide or narrow, open in the same plane or rarely some in different planes and the apex pendulous, giving the leaf a plumose appearance. Inflorescence paniculate, arising below the leaves, branching into 2 or 3 orders, peduncle 15 to 32 cm, rachis 54 to 69 cm, 11 to 24 primary branches; floral axes from 12 to 47 cm long, reddish in fruit. Small unisexual flowers, in groups of 3 with a female in the center and two male to the sides. Fruit a drupe ovoid apiculate at apex, 8 to 9 mm long by 6 to 7 mm wide, black when ripe (Figure 2).

Type: VENEZUELA. Miranda: Tovar, no date, H. Karsten 26 (holotype not known; isotype BM!).

Brief note on status of *G. undata* in Zulia state, Venezuela. As a result of the floristic survey carried out in June 2009. Only one individual of *G. undata* was found near an intersection of roads leading to two sections of the upper basin of the Lajas river. This single individual

FIGURE 2. Individual (left) and inflorescence and leaf sheath (right) of *Geonoma undata* Klotzsch.

is at risk of disappearing being very exposed at the side of the road. Some authors (Stauffer 1999, Mondragón *et al.* 2008, Maciel and Mendoza 2011) noted that the natural habitat of species such as *G. interrupta* var. *interrupta*, *G. spinescens* and *G. undata* from the cloud forests of the states of Aragua, Distrito Federal, Lara, Miranda and Yaracuy has been heavily altered by farming and urban development. In addition, the natural habitat of *G. undata* in the upper basin of the Lajas River in Zulia state is highly threatened by the increasing land use, mainly for the cultivation of *Xanthosoma sagittifolium* (L.) Schott, a tuber commonly known as malanga. It is urgent to study systematically the flora of this region which is disappearing quickly and still is poorly known, since it is difficult to carry out successful plans of conservation and ecological restoration.

In Venezuela, *G. undata* is listed as vulnerable (Llamozas *et al.* 2003), but it is necessary to carry out research on their current population biology to know its real status and establish the appropriate policies for conservation.

ACKNOWLEDGMENTS: The first author wants to thanks to Fundación Provita and the Iniciativa de Especies Amenazadas-IEA (Endangered Species Initiative) for their support for the development of a research project for the conservation of this endangered species. We thank to Carlos Portillo (IVIC – Zulia) for kindly providing the location map.
